

Guide: Onboarding for developers

This page describes how to onboard onto the project for developers and run the app.

Here is the link to the website:

[ant ride](#)

The backend is deployed on a digitalocean \$6/month VPS at [api.antride.ca](#)

Frontend repository

<link-to-github-repository>

Backend repository

<link-to-github-repository>

Database

You got invited to the supabase repo as well. To look at the tables created so far, go to the organization (<organization-name>), hover over the bar on the left hand side, and click on “Table Editor”.

How to start the app:

1. Open up the frontend and backend code in two separate VScode instances (or whatever editor you prefer, just make sure they are opened separately)
2. Make a new <environment-variables-filename> file in each repository containing the appropriate credentials that were shared with you
3. Run the following commands in this order in each repo separately at the same time to save time. Also, <some-json-file> contains the scripts that you can run:

```
1 yarn install # installs the packages
2 yarn run dev # runs the development servers
```

4. Now both the frontend and backend are running, and you can visit the site by going to `http://<host-name>:<port>` on a local browser window (this link is also on the command line output in the frontend code).
